

Coins in the Classroom: Oh, the State I'm In

The U.S. Mint's 50 State Quarter Program

PURPOSE This lesson is designed for 5th grade (upper elementary) students who have had little or no exposure to the world of numismatics. The purpose of this lesson is to make students familiar with basic terms used in numismatics and to acquaint them with the state quarter project undertaken by the United States Mint.

OBJECTIVES Students will be able to:

- List and define the parts of a coin.
- Research information about a state of the United States of America. (National Geographic Kids)
- Deliver a creative presentation based on research.

BACKGROUND The United States Mint introduced the States Quarters Program in 1999 to celebrate the statehood date for each of our nation's fifty states beginning with Delaware. The Mint has produced five different designs each year and completed the program by minting the last state quarter of Hawaii in August of 2008. The Washington Quarter has been produced since 1932. Initially the quarter was minted to celebrate the 200th anniversary of President Washington's birth.

MATERIALS

1. Give one state quarter to each student. It is best not to include your Own state.
2. 2x2 folders to use as storage for the coins.
3. Other methods of how coins can be stored. Examples include albums, flips, and housings used by professional grading companies often referred to as "slabs".

INTRODUCTION

Review with students how territories can become a state. Discuss the reasons particular territories have become states. Have students list the advantages and disadvantages of a territory becoming a state. Ask students which of our states was the first state and which is the latest as well as the dates they were admitted to the Union.

STUDENT ACTIVITIES

1. Have students select a quarter at random. Students are asked to look at their quarter and create a list of everything they see on the quarter. Students are then asked to refine the list to things that they believe appear on every quarter regardless of the state it represents.
2. Students will create a list of vocabulary terms used in numismatics. This list can include but is not limited to:

Obverse
Reverse
Field
Date

Motto
Mint Mark
Edge

3. Students will be shown the different ways a coin can be stored. Students will learn how to hold a coin.
4. Students will research their state information to identify the state flag, population, climate, motto, and main industry.
5. Students will present this information to the class using a visual aid of their choosing.

CONCLUSION

After every presentation, have the class choose one fact from the presentation that they found particularly interesting. They are then to take that fact and turn it into the form of a question. At the end of all of presentations, the questions should be put together to construct a quiz.
